

### Treating Complex PTSD and Dissociation with Integrative EMDR Therapy: A Resilience Informed Approach to Trauma Treatment

Arielle Schwartz, PhD

---

---

---

---

---

---

---

---

### PTSD, Chronic PTSD, C-PTSD

- **Acute Traumatic Stress:** Normal response after exposure to a traumatic event that includes panic, grief, and somatic symptoms.
- **Post Traumatic Stress (Disorder):** Symptoms continue to interfere with individual's life beyond 4 weeks after a traumatic incident (crime, accident, natural disaster)
- **Complex PTSD (C-PTSD):** Symptoms are related to repeated, prolonged exposure to traumatic events that often have a childhood onset and are often interpersonal (domestic violence, childhood abuse or neglect).

---

---

---

---

---

---

---

---

### Symptoms of C-PTSD

- Intrusive Memories
- Avoidance Symptoms
- Emotional Dysregulation
- Interpersonal Problems
- Cognitive Distortions (Inaccurate beliefs)
- Health Problems (ACE) and Chronic Pain
- Dissociation

---

---

---

---

---

---

---

---

### Symptoms of Dissociation:

**A range of symptoms:**

- Disconnected from body, thoughts, or emotions
- Feeling fuzzy
- Having a hard time verbalizing their experience
- Feeling dizzy
- "Loss of control"
- Disoriented
- Lack of distinction between past and present.
- Lapses of memory or "lost time"
- Multiple parts or sub-personalities.

---

---

---

---

---

---

---

---

### Dissociation: Disorder of Perception

**Challenge in recognizing that:**

- The traumatic event happened
- That the traumatic event happened to "me"
- The traumatic event is over
- I am here and now (not then and there)
- My body is part of me
- The me of then is part of the me now
- My actions in the present belong to me

---

---

---

---

---

---

---

---

### Defenses Maintain Dissociation

- **Repression:** "If I don't talk about or acknowledge my painful past it doesn't exist."
- **Denial:** "Yeah, I was abused but it wasn't a big deal"
- **Avoidance:** "If I just stay in bed and sleep I don't have to face reality"
- **Fantasy:** "If I just act like everything is okay then it will be okay."
- **Self-Blame/Idealization:** "If only I hadn't been so bad I wouldn't have been abused"

---

---

---

---

---

---

---

---

### Phobias Maintain Dissociation

- Phobia of:**
- Traumatic memories
  - Parts of self that carry shame
  - Attachment, relationship, and loss
  - Inner experience (arousal state, affect, body sensations)

---

---

---

---

---

---

---

---

### Working with C-PTSD:

**Evokes feelings of:**

- Helplessness
- Hopelessness/Despair
- Isolation/Loneliness
- Injustice/Unfairness
- Suffering
- Rage
- Evil
- Meaning/Purpose put in question

---

---

---

---

---

---

---

---

### Personal Inquiry

- What resources help you stay present with your clients as they experience helplessness, despair, suffering, uncertainty, disappointment, and loss?
- What meaning making, spiritual perspectives, or self-care practices help you attend to the weight of this work?

---

---

---

---

---

---

---

---

### Treating C-PTSD

• Increase your client's capacity to stay present with and effectively respond to (regulate):

- States of mind
- Emotions
- Sensations
- Interpersonal exchanges

---

---

---

---

---

---

---

---

### Develop Tolerance For:

- Uncertainty
- Ambiguity
- Disappointment and loss
- Conflict and Compromise
- Difference
- Competing needs and desires
- Conflicting ideas and emotions

---

---

---

---

---

---

---

---

### Goals of Treatment

The client is able to say:

- The trauma happened to me
- I am aware of my past and how it affects me in the present
- The past is differentiated from the present (It is over now)
- I can be mindful of the present moment
- I can sense and feel my body now
- I have choices now about my thoughts, emotions, and behaviors.
- I can orient toward the future

---

---

---

---

---

---

---

---

### EMDR Therapy

- Not an Intervention—A Theoretical Orientation
- Dual Attention State (DAS)
  - Bilateral Stimulation
- Resource Development Installation
  - Safe place, Containment, Grounding, Allies
- Body Based and Present Centered
  - Nervous system regulation, Pendulation
- Emphasis on Relationship
  - Rapport, Transference and countertransference, Contact statements, Relational Interweaves

---

---

---

---

---

---

---

---

### 8 Phases of EMDR Therapy

- **Phase 1 History Taking:** Develop case conceptualization of client within context of life, identify trauma history.
- **Phase 2 Preparation:** Establish therapeutic relationship, Stabilize and build skills, Resource Development Installation (RDI)
- **Phase 3 Assessment:** Target development, “light up” the traumatic event with the disturbing image, emotions, beliefs, and body sensations

---

---

---

---

---

---

---

---

- **Phase 4 Desensitization:** Uses DAS to process the disturbing material related to trauma target until the client reports no disturbance (SUDS)
- **Phase 5 Installation:** Strengthens positive beliefs that arise after the successful completion of desensitization.
- **Phase 6 Body Scan:** Release lingering tension
- **Phase 7 Closure:** Ensures client is resourced prior to ending the session, Containment
- **Phase 8 Re-evaluation:** Review of efficacy of treatment from previous session.

---

---

---

---

---

---

---

---

### Integrative EMDR Therapy for C-PTSD

---

---

---

---

---

---

---

---

Effective trauma treatment involves a balance between the regulating function of top-down processing and the accessing function of bottom-up processing (van der Kolk, 2003)

---

---

---

---

---

---

---

---

### Top-Down or Bottom-Up Interventions

**Top-Down Interventions:**

- Engages upper brain centers in the neocortex to provide regulating, conscious, thought-based tools for addressing trauma symptoms.
- Pressing on the brakes- slows down processing

**Bottom-up Interventions:**

- Engages the lower brain centers in the limbic system and brain stem to help the client access emotional and sensory components of traumatic material.
- Pressing on the gas- speeds up processing

---

---

---

---

---

---

---

---

### Top-Down Interventions

- Psychoeducation (e.g. teach somatic vocabulary)
- Mindfulness
- Cognitive interventions such as identifying negative and positive beliefs or challenging thinking errors
- Resourcing interventions (grounding, establishing safety, developing containment)
- Talking about traumatic events
- Conscious Breathing

---

---

---

---

---

---

---

---

### Bottom-Up Interventions

- Focus on body sensations (e.g. body scan)
- Sequence or discharge tension out of body
- Invite movement to facilitate somatic release
- Follow movement impulses
- Titration: experiencing small amounts of distress with the goal of discharging physical tension
- Pendulation: an oscillation between feeling distress and feeling safe or calm in the present moment
- Conscious Breathing

---

---

---

---

---

---

---

---

### Somatic Psychology

- **Embodied Self Awareness:** Attention to body sensations and breath
- **Grounding:** 5 senses (hearing, seeing, smelling, tasting, touching) anchor client in here and now
- **Regulation Model:** Physiological regulation with the Window of Tolerance
- **Sequencing:** Movement of tension out from the core of your body through periphery of body.
- **Pendulation and Titration:** Alternating between resource and distress

---

---

---

---

---

---

---

---

Somatic therapies are not just a set of interventions for the client, they are the foundation for the attuned presence of the therapist.

---

---

---

---

---

---

---

---

### Working within the Window of Tolerance

- **Window of Tolerance:** an optimal zone of nervous system arousal where clients are able to respond effectively to their emotions and sensations (Siegel, 1999)
- **Above the Window:** Feeling anxious, overwhelmed, or panicked is a sign that the client is hyper- or over-aroused.
- **Below the Window:** Feeling shut down, numb, or disconnected is a sign that you are hypo- or under-aroused.

---

---

---

---

---

---

---

---

Window of Tolerance

---

---

---

---

---

---

---

---

### Integrative EMDR Therapy for C-PTSD

#### Mind-Body Therapies:

- Complementary and Alternative Medicine (CAM)
- Nutrition
- Massage
- Acupuncture
- Trauma Sensitive Yoga
- Tai Chi, Qigong

---

---

---

---

---

---

---

---

### Preverbal and Nonverbal Memories

- Earliest attachment memories are stored as representations of motor patterns and sensations
- Traumatic stress can impair the brain structures involved with explicit memory (van der Kolk, 2015) in which memories are stored as fragments of disconnected sensory and bodily experiences.

---

---

---

---

---

---

---

---

### Ego States and Parts Work

- **Assessment of and treatment of dissociation:** Look for subtle signs as well as overt symptoms
- **Observe cues of parts:**
  - Voice tone
  - Body posture
  - Changes in eye contact
  - Repetitive movements, such as hair twirling, skin picking, or nail biting
  - Changes in breathing patterns such as holding the breath
  - Body symptoms such as the onset of a headache, nausea, dizziness, or pain

---

---

---

---

---

---

---

---

### Parts Work

Apparently Normal Self (ANP): persona, superego  
 Defenses: perfectionism, control, idealism, addictions  
 Exiled Part (EP): emotions, sensations, or memories

---

---

---

---

---

---

---

---

### Mutual Regulation and Relational Work

- Your task is to accept what the client cannot and to facilitate greater integration at a pace that the client can tolerate
- Explore transference and countertransference
- Re-enactments are inevitable
- Ruptures and repair provide opportunities for new learning

---

---

---

---

---

---

---

---

### Embodiment in Mutual Regulation

- Therapist and client mutually influence each other throughout therapy.
- When therapists attune to their own embodied awareness during sessions, they can sense subtle changes that may provide insight into the experience of the client.

---

---

---

---

---

---

---

---

### Emphasis on Self-Care

- Prevention of Stress and Burnout
- Clinician provides External Regulation
- Own embodiment and mindfulness practice
- Own supervision and/or therapy

---

---

---

---

---

---

---

---

### Resilience Informed Therapy

- **Biopsychosocial:** Not a medical model (Doctor/Patient), Partnership and Collaborative
- **Strength Based:** What is already working?
- **Resilience:** Resilience is adapting well in the face of adversity-bouncing back from difficult events
- **Post Traumatic Growth:** Improved self-perception, enhanced relationships, and a strengthened life philosophy that occur after exposure to a traumatic event. "I'm stronger as a result"

---

---

---

---

---

---

---

---

### Trauma Recovery and the Bell Curve

(Martin Seligman, Positive Psychology)

---

---

---

---

---

---

---

---

### Questions of Resiliency

- Why do some people respond better to traumatic experiences than others?
- What coping strategies and behaviors are associated with the greatest **adaptation** to traumatic life events?
- What are the most effective means of integrating these strategies into our lives?

---

---

---

---

---

---

---

---

**Resilience is not a trait that people either have or do not have. It involves behaviors, thoughts, and actions that can be learned and practiced.**

---

---

---

---

---

---

---

---

### Factors of Resilience and PTG

- **Challenge:** Believing that growth and wisdom are gained from difficult or challenging experiences.
- **Control:** Rather than lapse into passivity and powerlessness; the belief that with effort you can influence the course of events in your life
- **Commitment:** The ability to stay involved; staying engaged in ongoing events rather than isolating.

(Salvidore Maddi, The Hardiness Institute)

---

---

---

---

---

---

---

---

## Resilience Informed Therapy

- **Support Systems:** Resilience Factors (Social Connection, Self-Care, Exercise, etc.)
- **Health and Wellness:** Build a Collaborative Treatment Team
- **Trauma Treatment:** Single Incident, Chronic PTSD, Complex PTSD, ACE Factors
- **Family History:** Understanding Symptoms in Context: Childhood Development, Family history, Transgenerational Story, Culture
